

Safety management in daily railway practice

DESCRIPTION

The topic of "safety management" is a central issue in everyday life for rail transport and rail infrastructure companies.

Your company has already received a safety certificate/authorisation and you would like to know how to proceed the further steps?

We would like to answer this question for you not only from a theoretical point of view, but also present practical examples of how regular changes and reviews can be implemented. The further development of your safety management system is a central part of strengthening the safety policy and culture in your company.
